## SHELL IN GEAR OILS

Within almost every type of machinery, these wheels with teeth, play a vital role because of their ability to transmit power smoothly, efficiently and conveniently.

The efficiency with which gears operate however, depends not only on

the way in which they are used, but also on the design of lubricants applied to them.

Today's gears are designed to achieve higher levels of performance than ever before and require a range of increasingly complex and high

quality lubricants. The role of the lubricant is vital.

The correct choice will mean prolong the life and efficient running of machinery. The wrong choice may mean the complete failure of vital equipment.
